

# EMAIL OSINT — THE MASTER KEY

How one address maps a footprint — and how to defend it

SKILL SHEET · W1D0WM4K3R · B1SCU1TK1D.COM · 2026-10-03

An email address is the master key to a digital footprint. It is the login string tied to almost every account, and the one identifier that correlates them all. Attackers rarely start with a name — they start with the address.

## THE PIVOT CHAIN

email → registered services → username → social footprint → PII → breach data → account takeover

## THE TOOLKIT (ALL PUBLIC, FREE)

### Holehe →

Checks an address against 150+ services for a registered account — silently, no verification email.

### GHunt →

Google footprint from a Gmail: name, profile photo, Maps contributions, calendar status.

### Have I Been Pwned →

Is this address in a known breach — and what spilled with it.

### Gravatar →

Email → avatar. Often the same profile picture reused across sites — a fingerprint.

### Sherlock →

Once a username is extracted, sweep 400+ platforms for it.

### Maigret →

Username → thousands of sites, compiled into one report.

### emailrep.io →

Reputation scoring — spam, fraud, and social-media presence signal.

## THE DEFENSE

- Unique email per service — catch-all domain or + aliasing (name+bank@gmail.com)
- Masked email — SimpleLogin / AnonAddy relay your real address
- Never reuse a password — a password manager makes this free
- Check yourself first — run your own address through HIBP and Holehe

Masked email: SimpleLogin → simplelogin.io · AnonAddy → addy.io

## THE RULE

Publish the method. Protect the private context. This sheet covers capability and defense only — no targets, no cases, no people.
